About me

Jan Bielecki (1994 - ?)

Senior Full Stack Developer at Ørsted (2023 - ?)

Jan Bielecki (1994 - ?)

"Any sufficiently advanced technology is indistinguishable from magic."

~ Arthur C. Clarke

Jan Bielecki (1994 - ?)

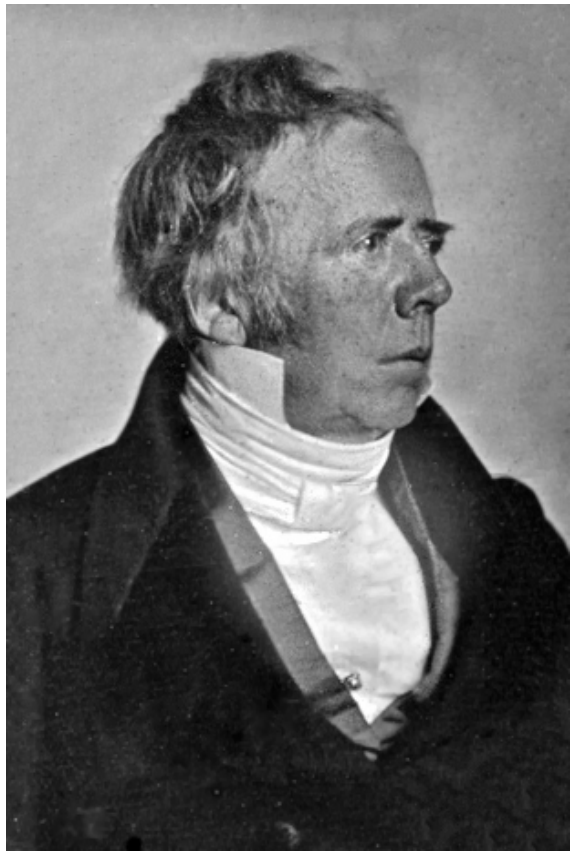

Running, Calistenics, Ping-pong, Foosball, Trekking, Snowboarding.

About Ørsted

Hans Christian Ørsted (1777 - 1851)

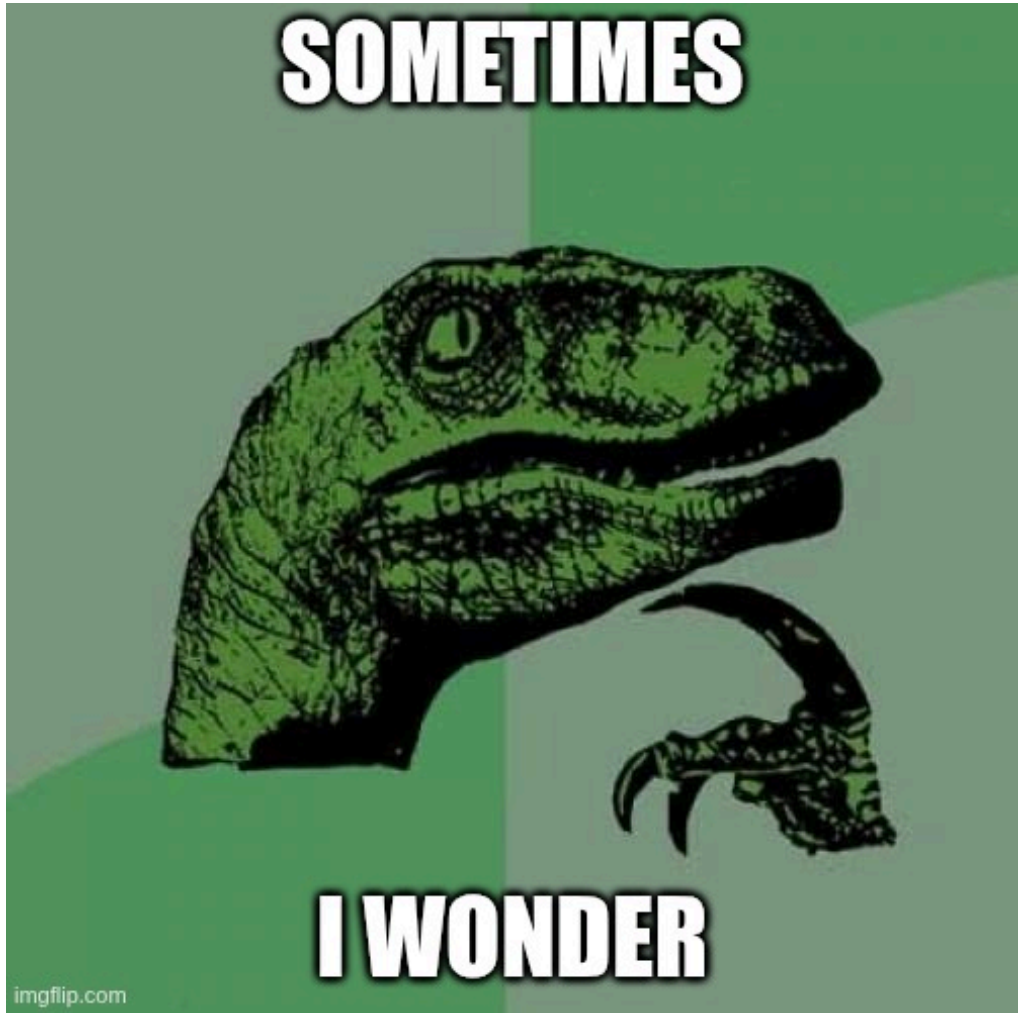

Close friend of a Hans Christian Andersen (1805 - 1875), author of many fairy tales, including "The Little Mermaid" and "The Ugly Duckling").

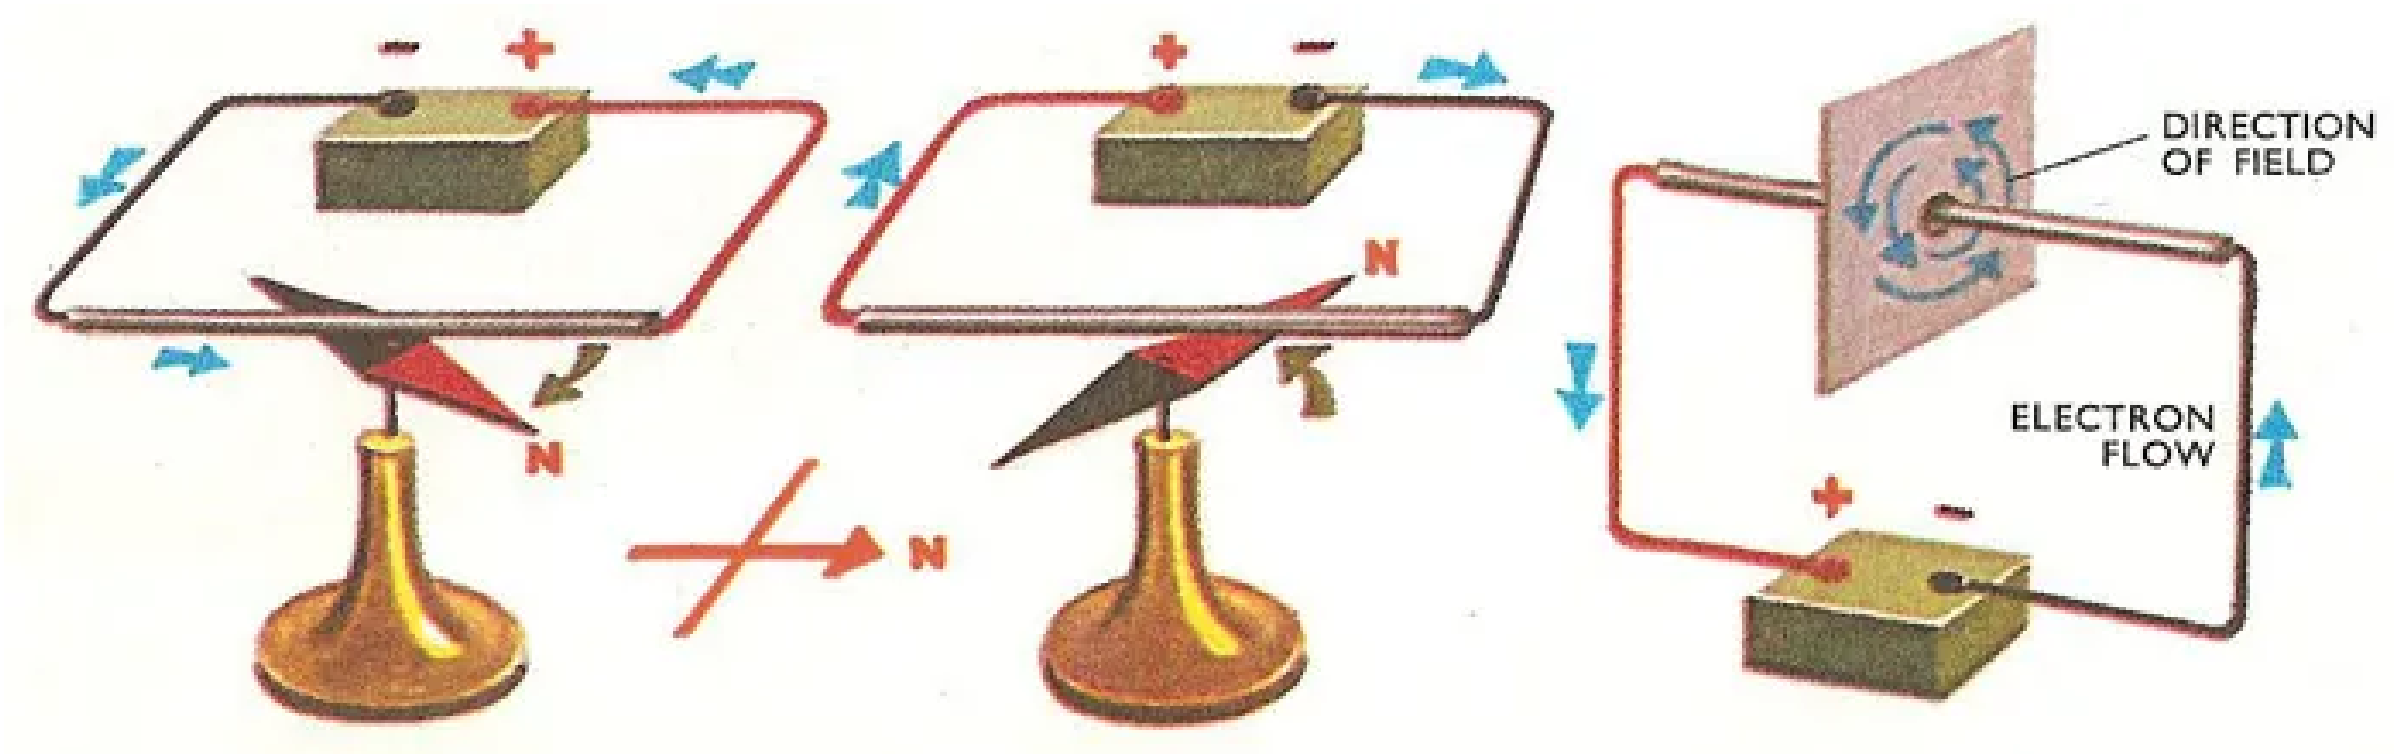

https://en.wikipedia.org/wiki/Hans_Christian_Andersen

Hans Christian Ørsted (1777 - 1851)

First to explicitly describe and name the "thought experiment".

Hans Christian Ørsted (1777 - 1851)

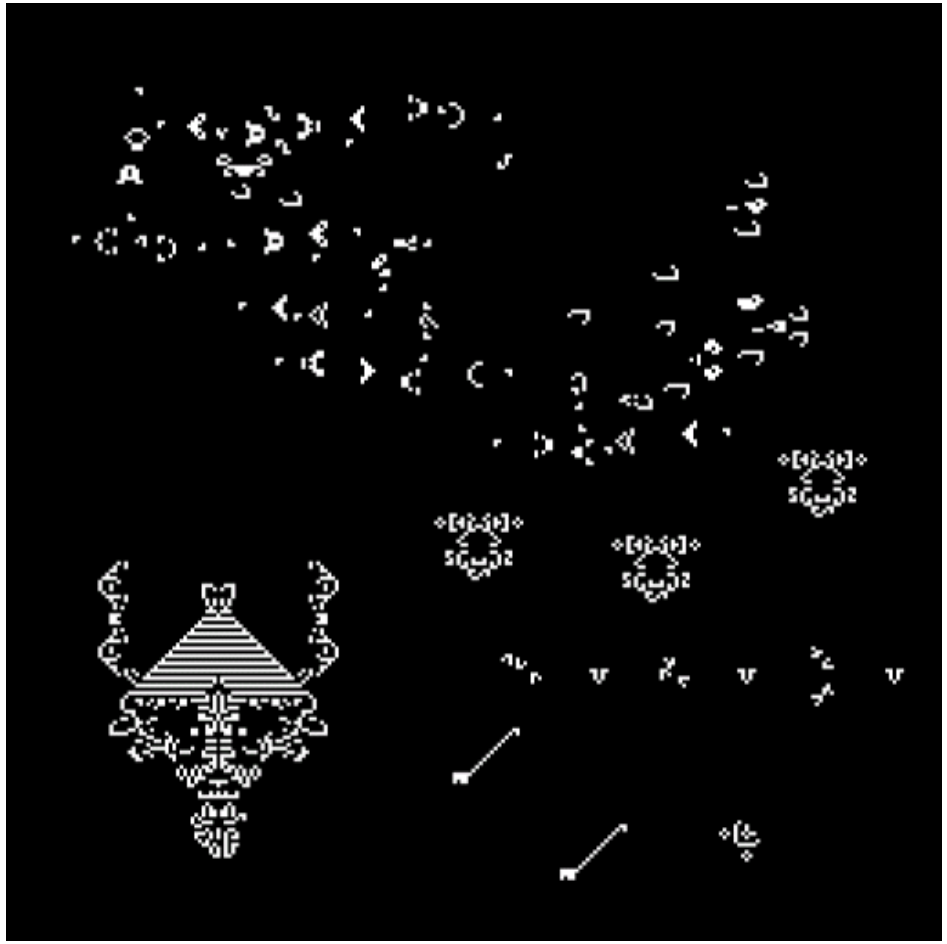

In 1820, Ørsted published his discovery that a compass needle was deflected from magnetic north by a nearby electric current.

https://subratachak.wordpress.com/2017/12/16/oerstead/

DefinIT philosophy

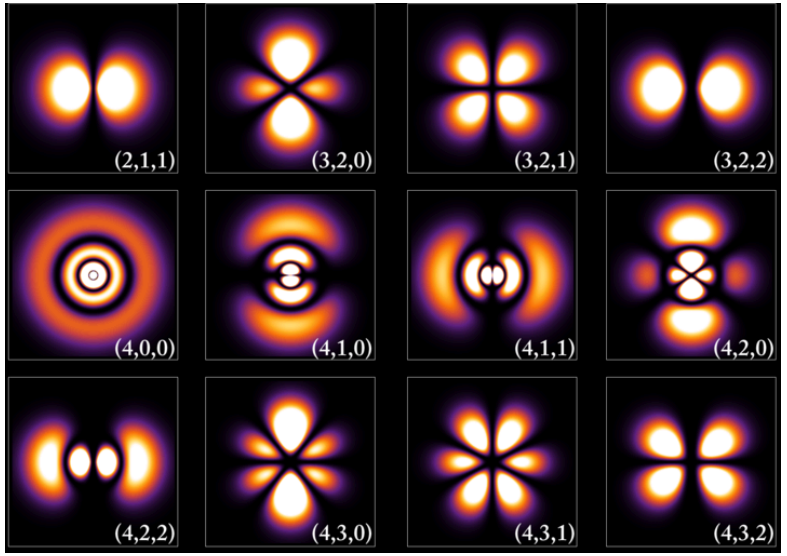

John Conway (1937 - 2020)

Conway's Game of Life.

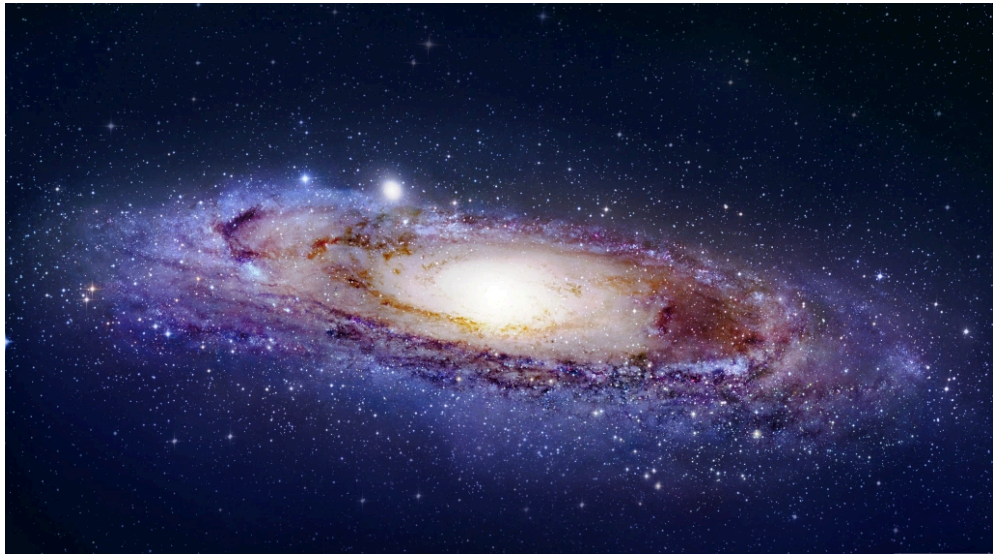

https://johnhorgan.org/cross-check/quantum-mechanics-free-will-and-the-game-of-life

Definitions as "patterns in the universe"

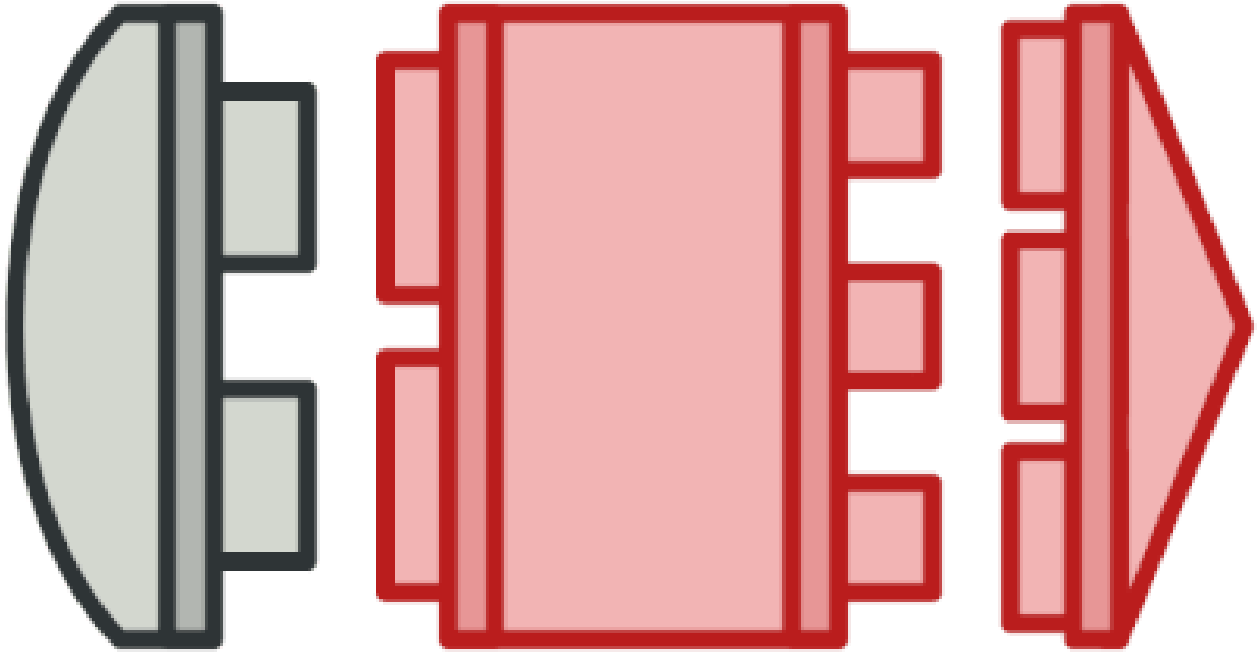

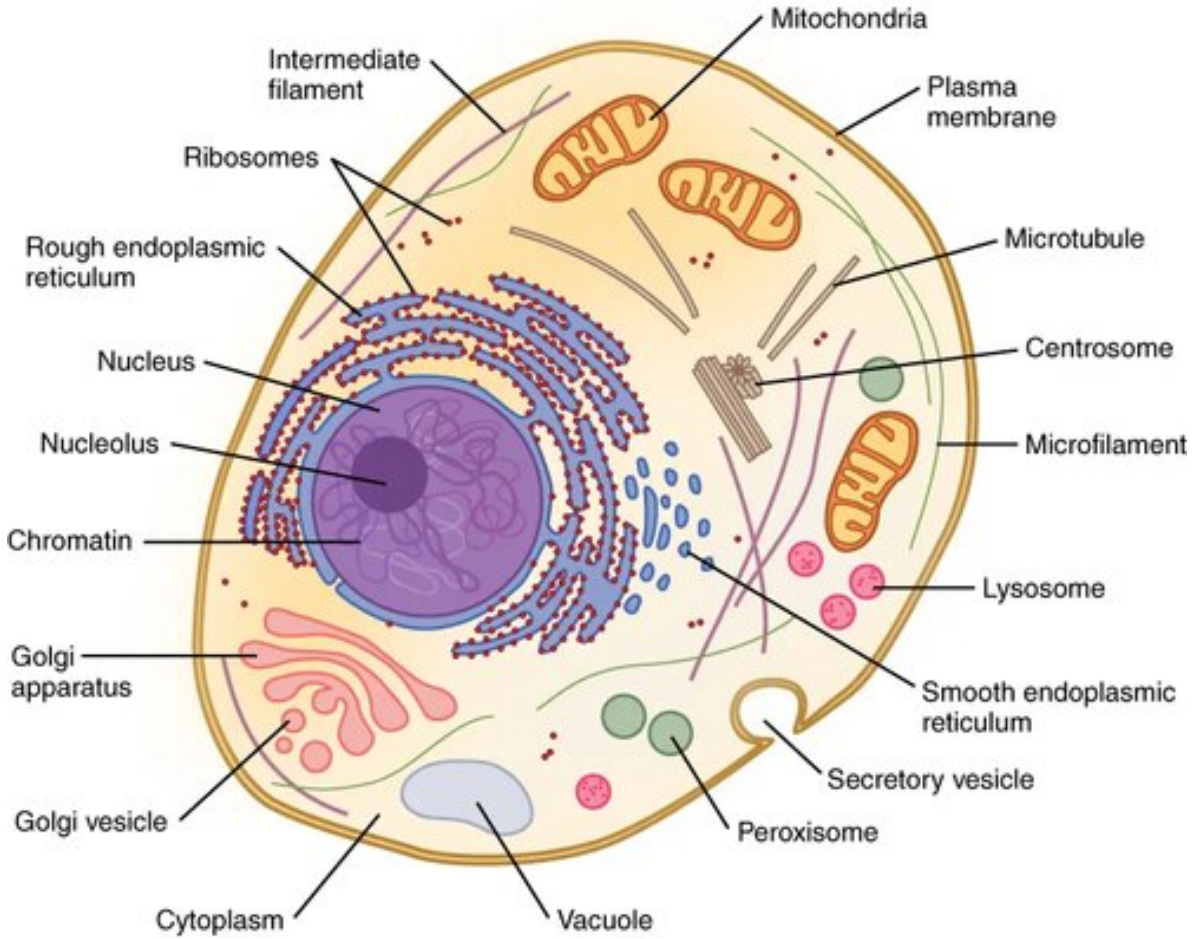

Patterns in computer science

The adapter design pattern.

https://thecodinggopher.substack.com/p/the-adapter-design-pattern

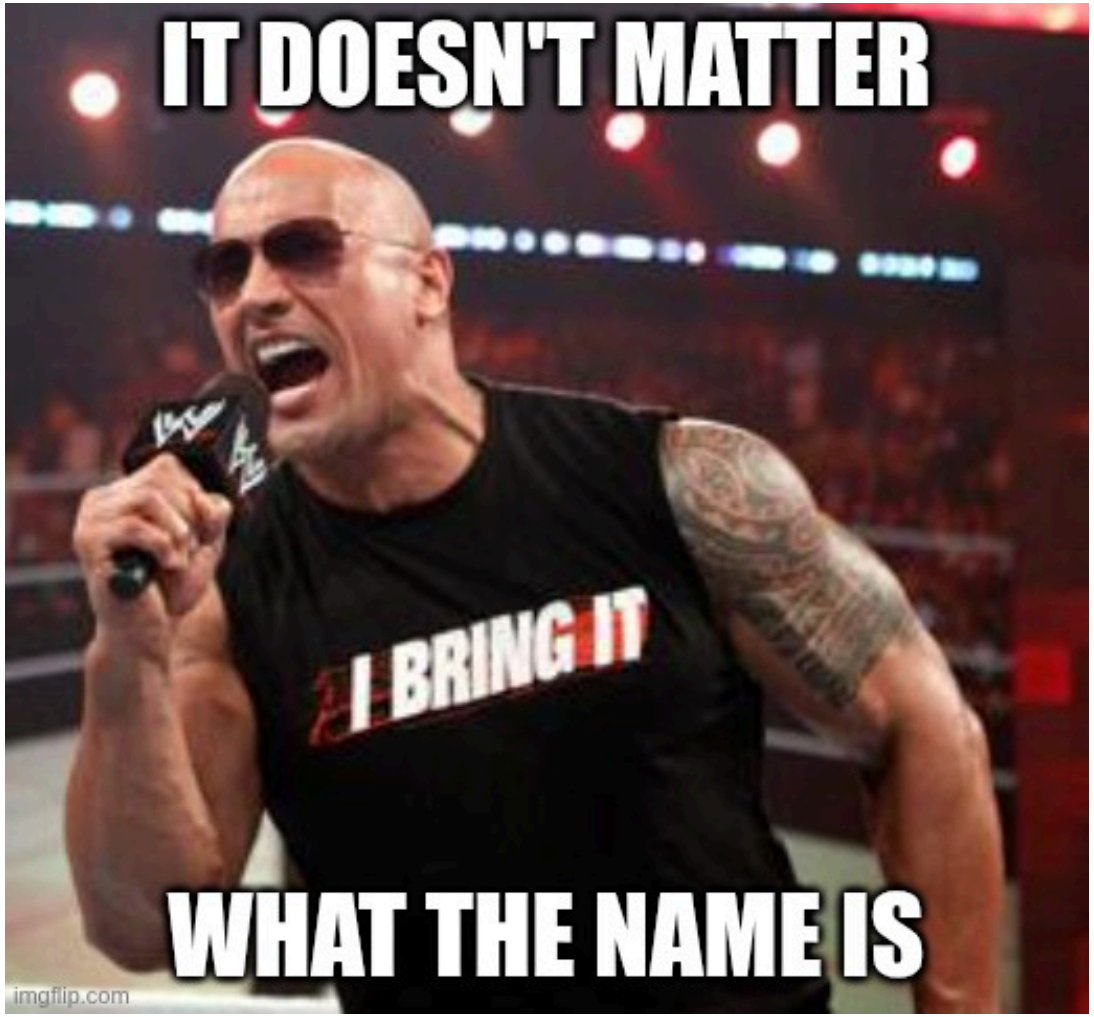

The theory of acyclic references in terminology

The exercise is to describe mitochondria without referring to the cell.

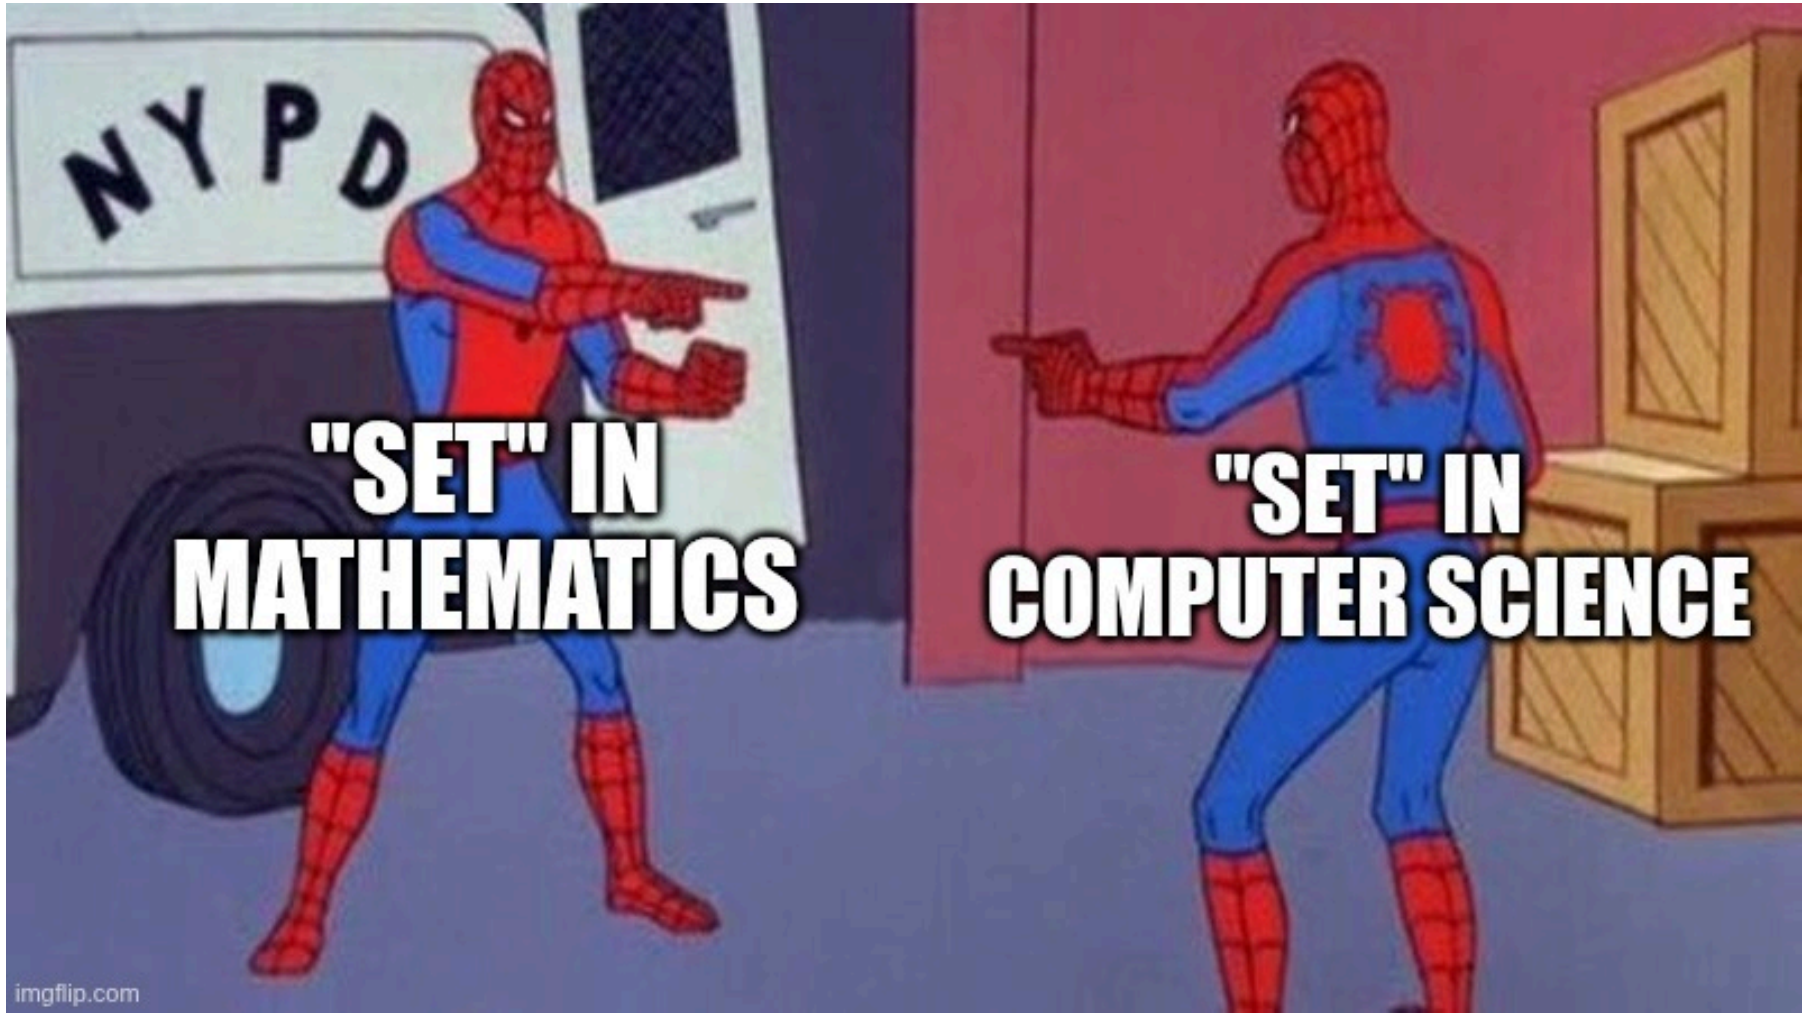

https://en.wikipedia.org/wiki/Cell_(biology)

Naming is irrelevant

Naming does not matter, or at least is a secondary concern.

Languages are ambiguous

A single word can have different meanings.

An experiment to "prove the theory"

"In theory, there is no difference between theory and practice. But in practice, there is."

~ Benjamin Brewster

Literature review

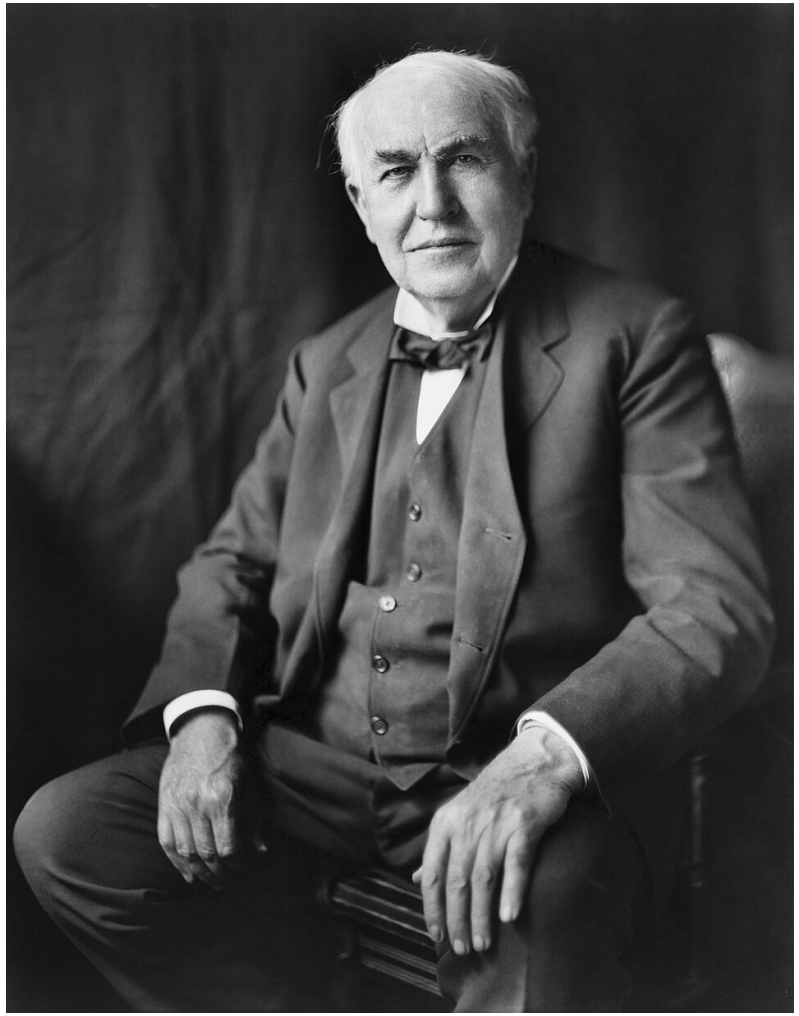

Standardized glossary in computing

A glossary is a focused collection of SPECIALIZED terms and DEFINITIONS tied to a SPECIFIC SUBJECT, book, or document.

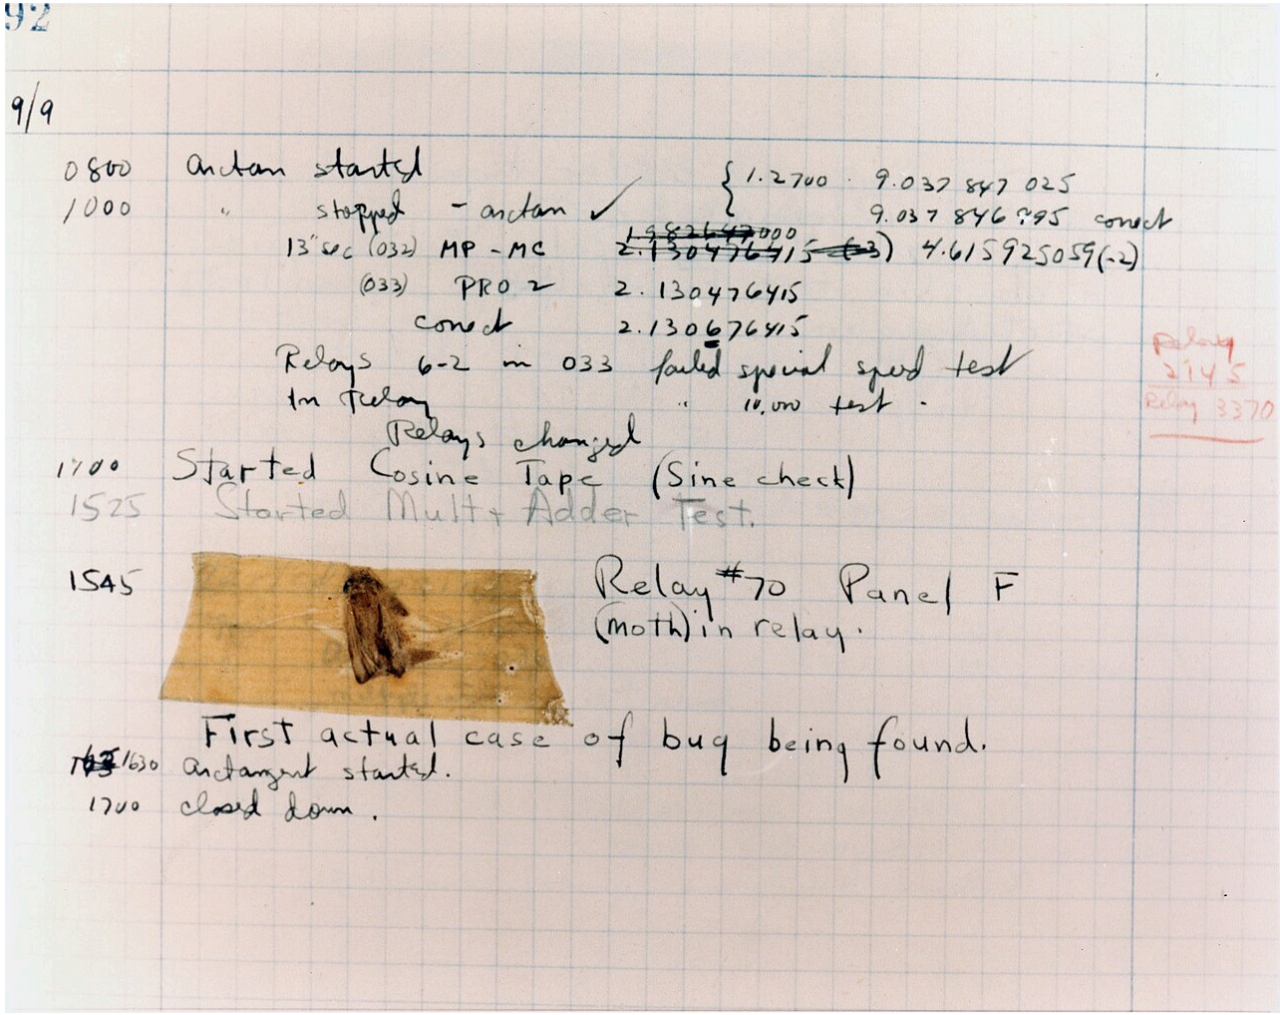

https://dataedo.com/cartoon/glossary-or-dictionary

Thomas Edison (1847 - 1931)

"Bugs" - little faults and difficulties.

Grace Hopper (1906 - 1992)

"First actual case of bug being found."

Grace Hopper (1906 - 1992)

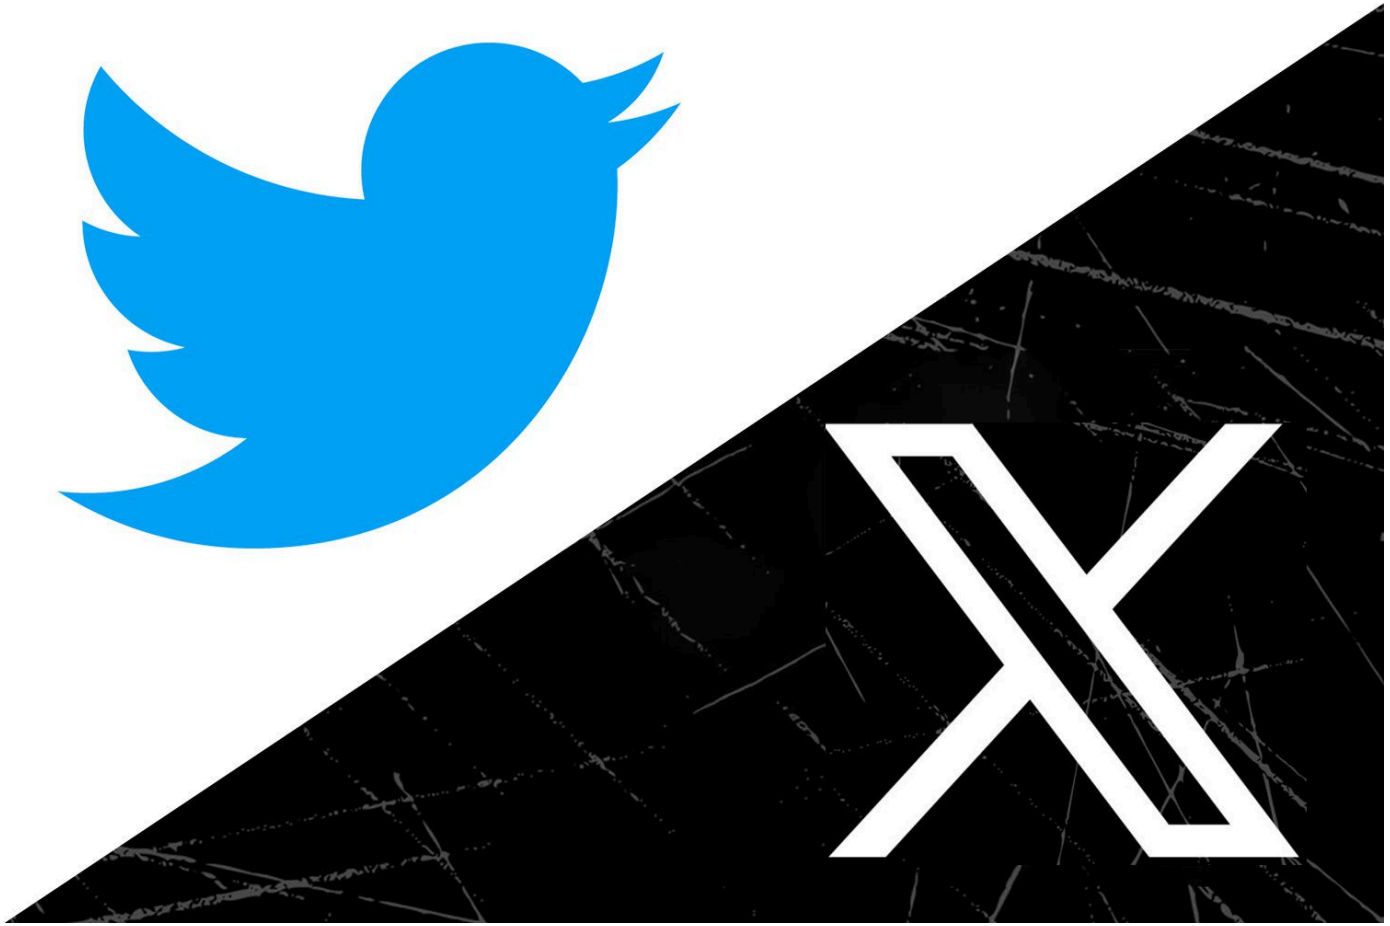

"First Glossary of Programming Terminology"

Eugen Wüster (1898 - 1977)

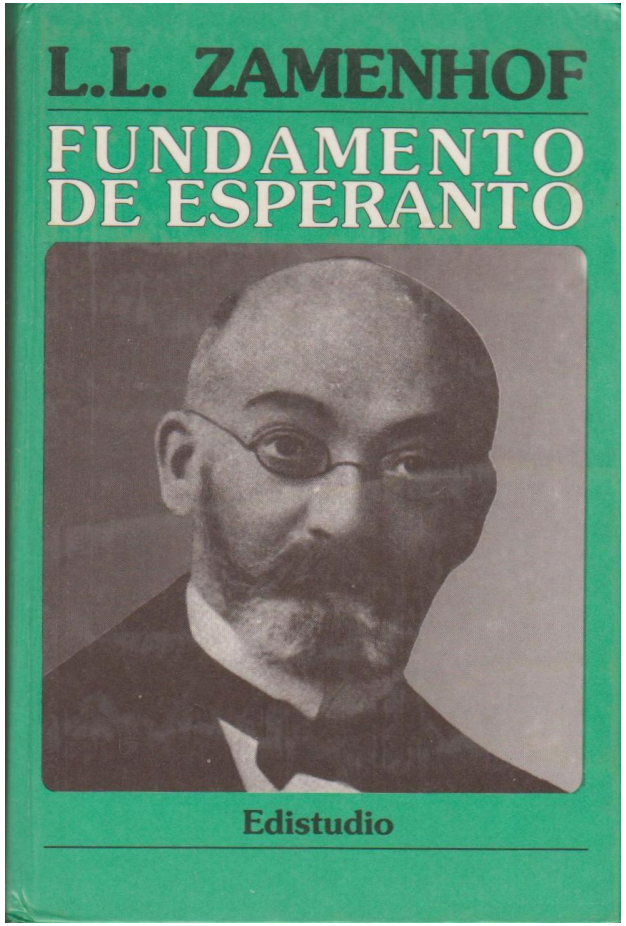

Eugen Wüster is often recognized as the founder of terminology.

Eugen Wüster (1898 - 1977)

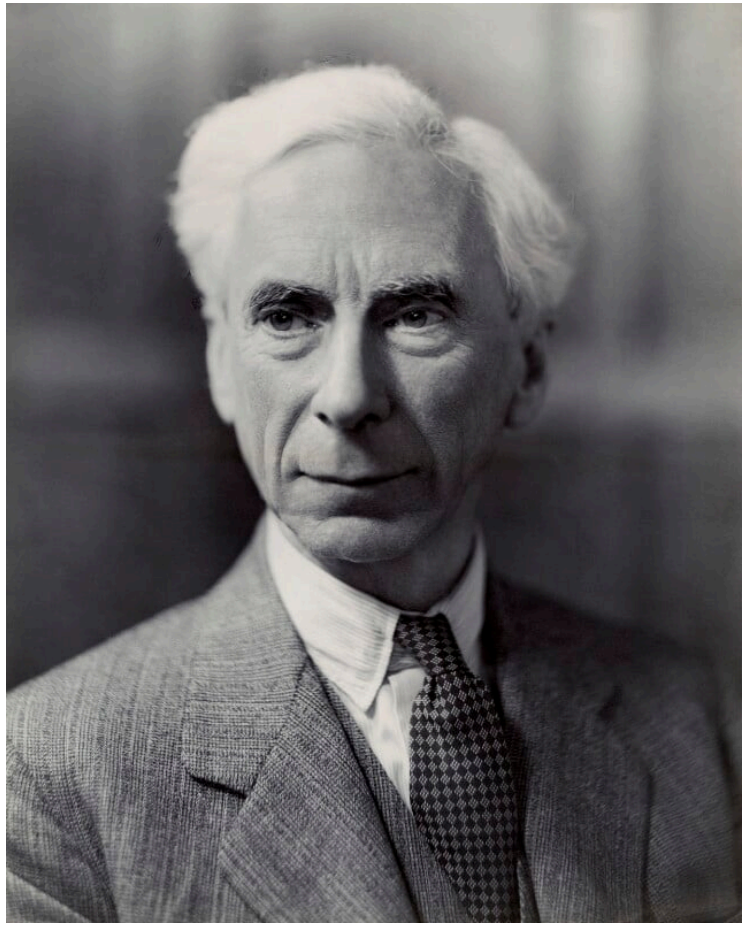

"Concepts (or definitions) exist even before they are named - thus naming and it relevance for the terminology field have been neglected."

Ludwik Zamenhof (1859 - 1917)

Wüster was a staunch advocate of a single language for scientific and technical communication.

Bertrand Russell (1872 - 1970)

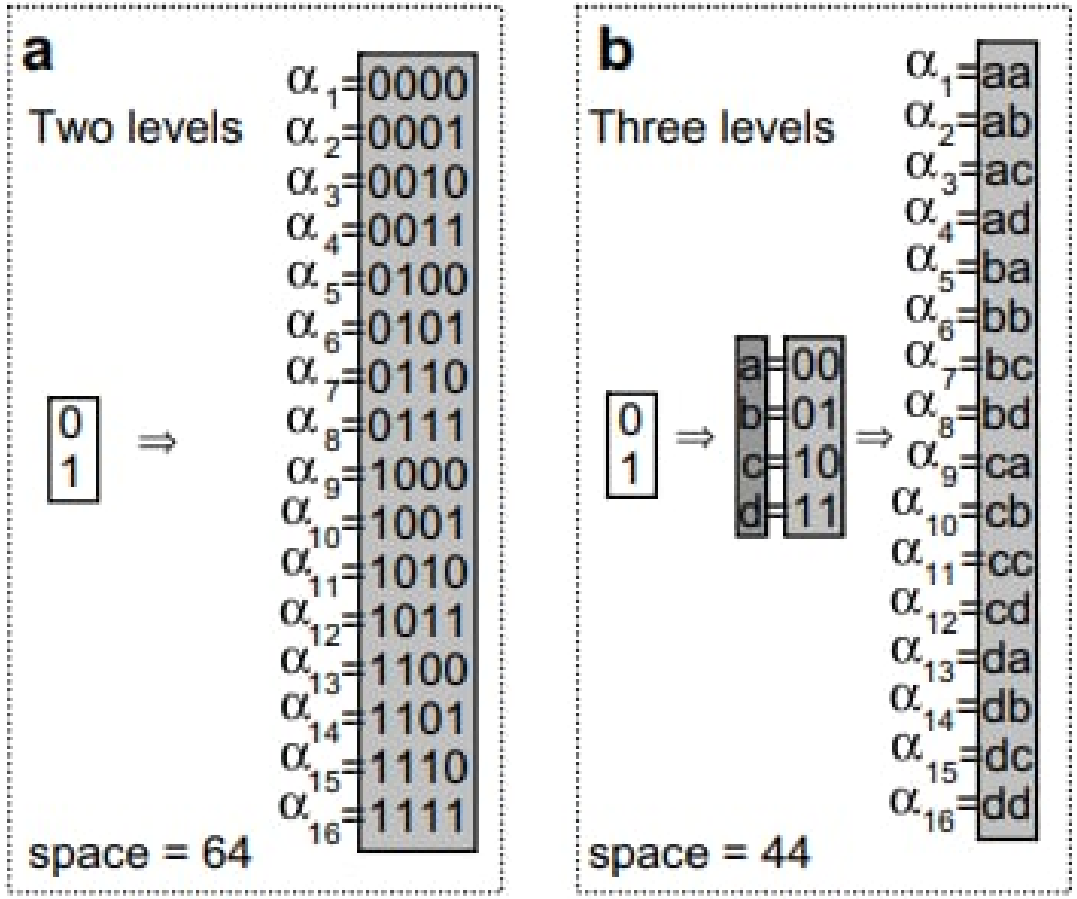

In 1950, Russell was awarded the Nobel Prize in Literature "(...) he champions humanitarian ideals and freedom of thought".

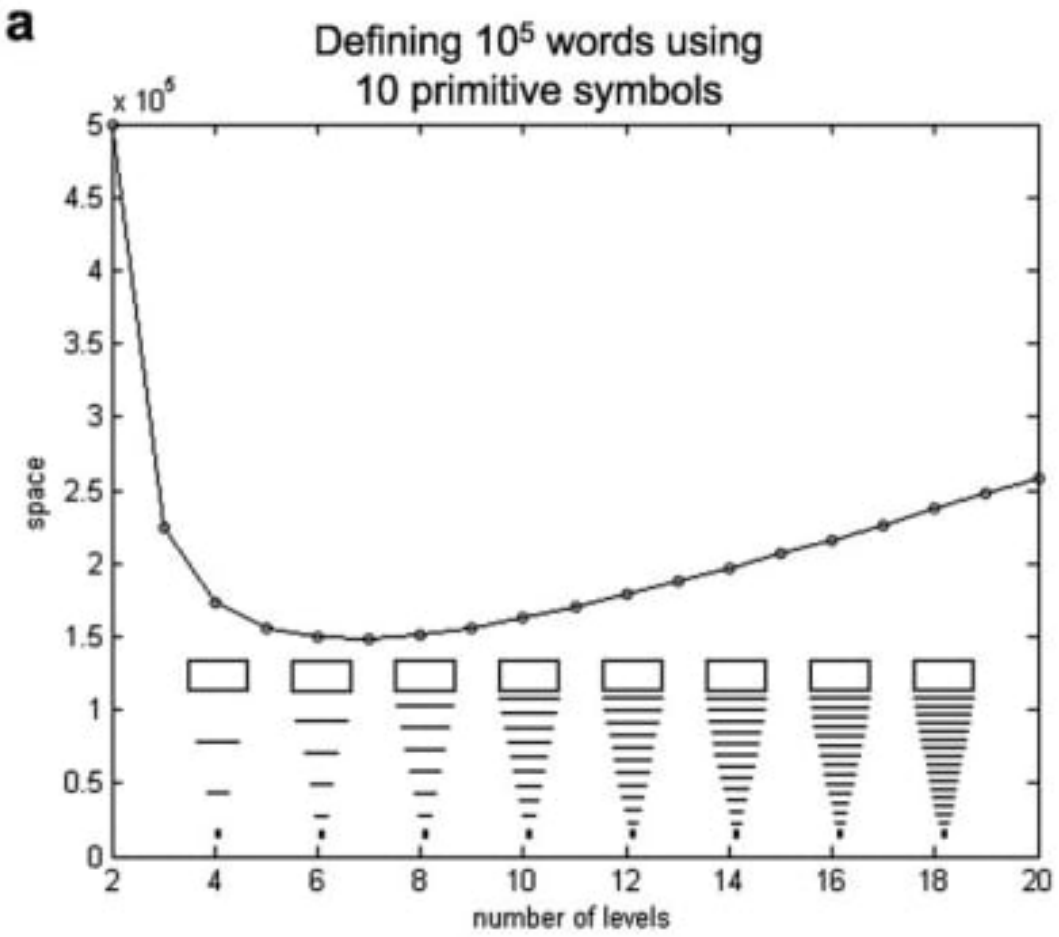

Logical atomism

The world is composed of independent, irreducible units of reality (logical atoms).

Mark Changizi (1969 - ?)

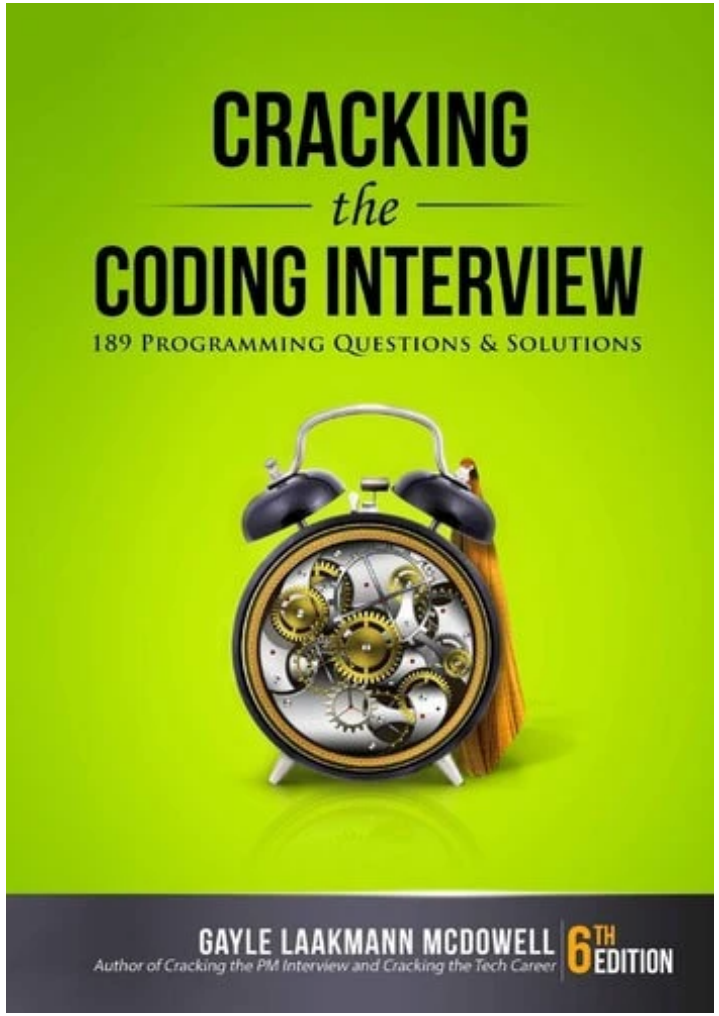

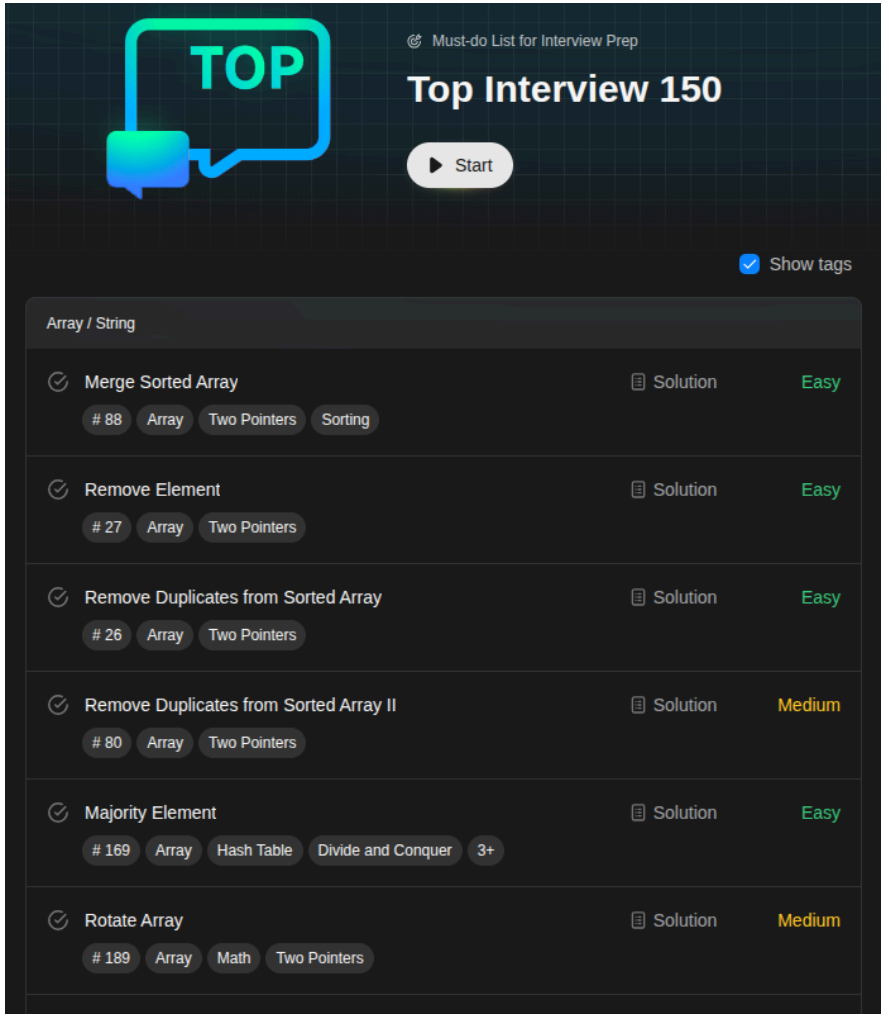

Economically organized hierarchies in WordNet and the Oxford English Dictionary

https://www.sciencedirect.com/science/article/abs/pii/S1389041708000120

Data Structures and Algorithms course

How it was created

Transform the content of a book or a course into DefinIT format.

DefinIT format

```python
from definit.definition.definition import Definition
from definit.definition.definition_key import DefinitionKey

from definit_db.data.field import FieldName
from definit_db.data.field.mathematics.definitions.fundamental.object import OBJECT
from definit_db.data.field.mathematics.definitions.fundamental.plane import PLANE
from definit_db.data.field.mathematics.definitions.fundamental.transformation import TRANSFORMATION

    Jan Bielecki, 2 months ago | author (Jan Bielecki)
class _Axis(Definition):
    def _get_content(self) -> str:
        return f"""
An axis is a reference line about which a geometric or coordinate space is organized. Positions may be measured
along an axis (as coordinates are along the x-axis and y-axis of a {PLANE.key.get_reference()}), and
{TRANSFORMATION.key.get_reference(phrase="transformations")} may be defined with respect to an axis (as a
reflection mirrors points across it). An axis is itself an
{OBJECT.key.get_reference(phrase="object")} of the space.

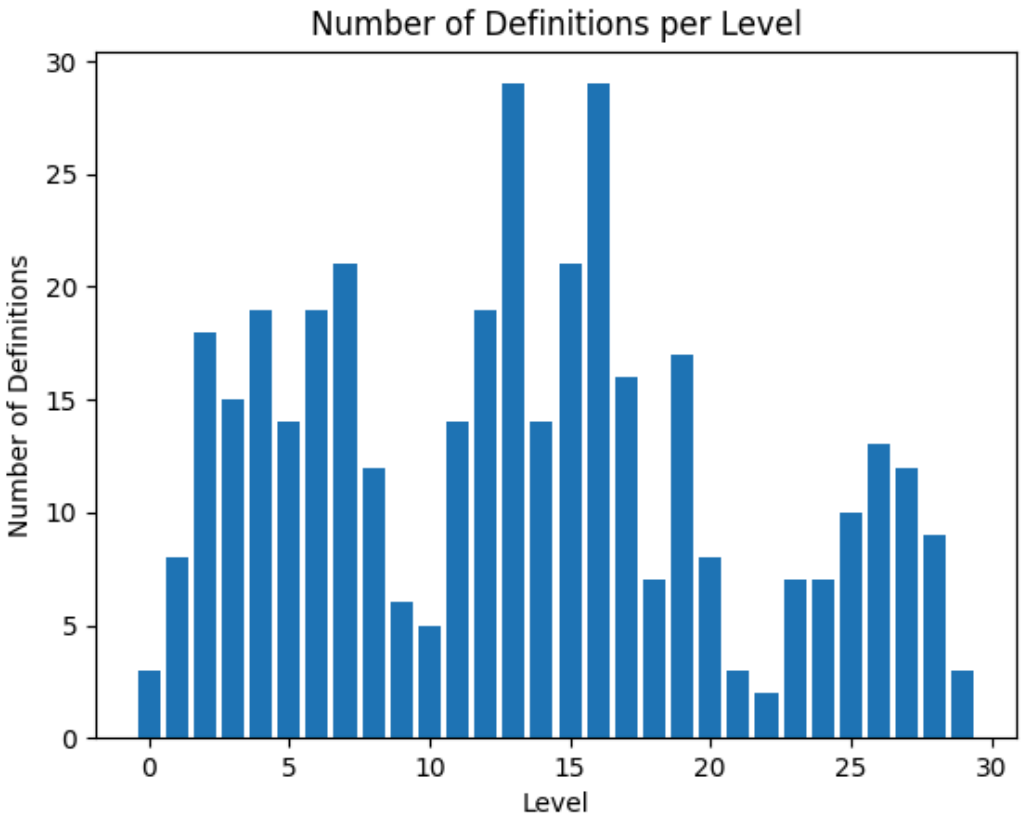

---

In the two-dimensional plane, the x-axis and y-axis are two perpendicular reference lines. The point (3, 5) is
located three units along the x-axis and five units along the y-axis. Reflecting that point across the x-axis
gives (3, -5): the axis serves both as a basis for measuring position and as the line of reflection.
"""

AXIS = _Axis(
    key=DefinitionKey(
        name="axis",
        field=FieldName.MATHEMATICS,
    )
)
```

Definition as a Python module.

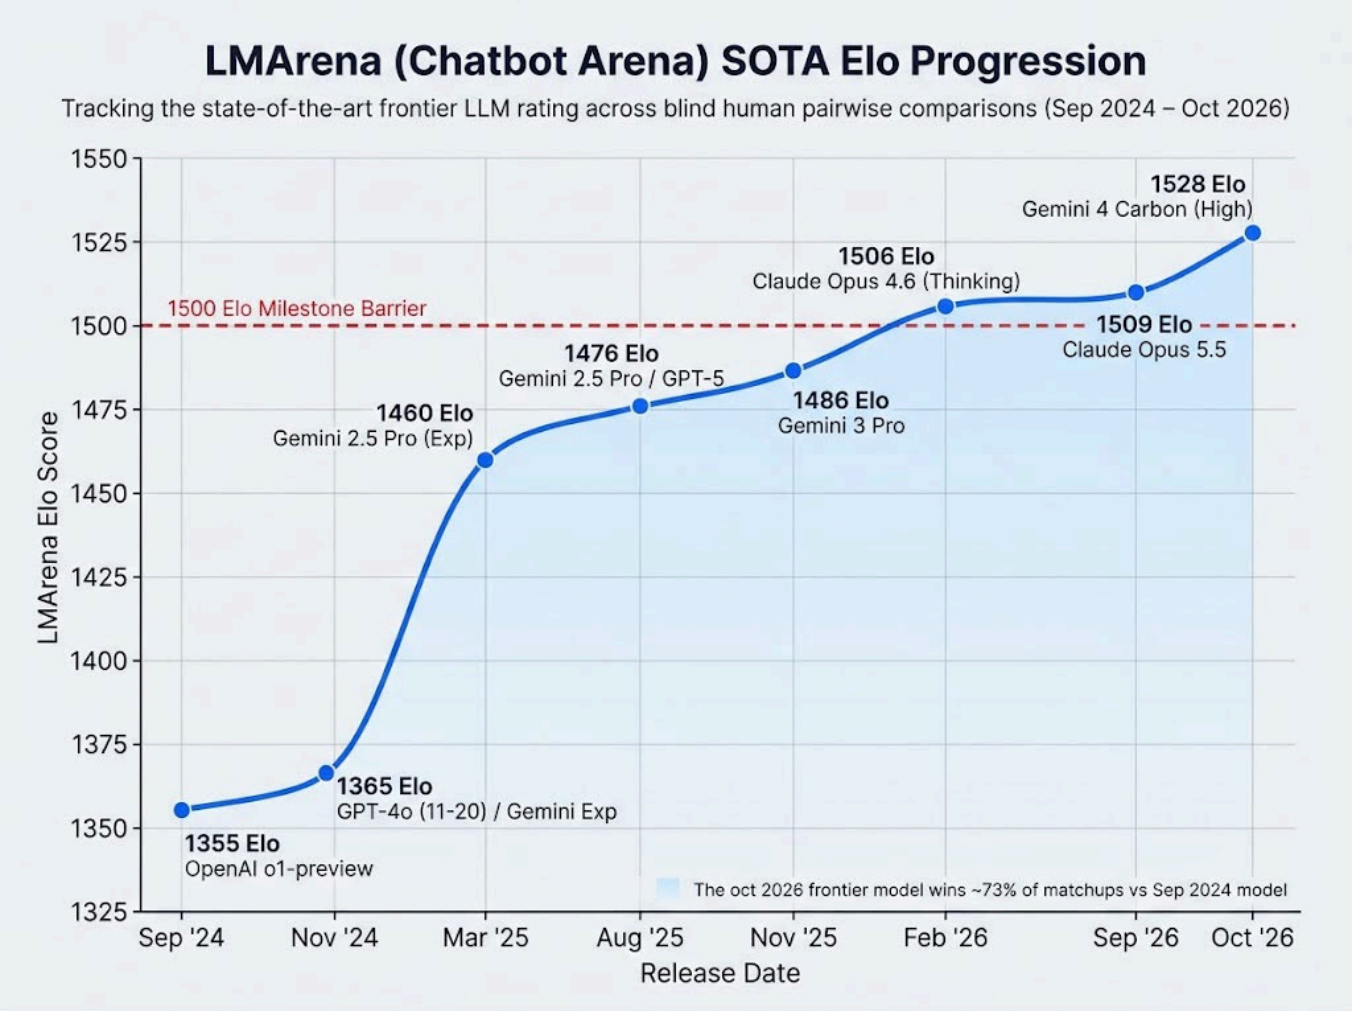

DSA course statistics

Word	Occurrences	Distinct definitions
every	100	70
left	61	29
exactly	51	38
given	50	46
position	50	27
result	47	36
represent	46	33
since	45	39
example	44	42
produce	44	36

30 levels, 380 definitions, ~1700 unique non-definition words and 1783 references.

Issues

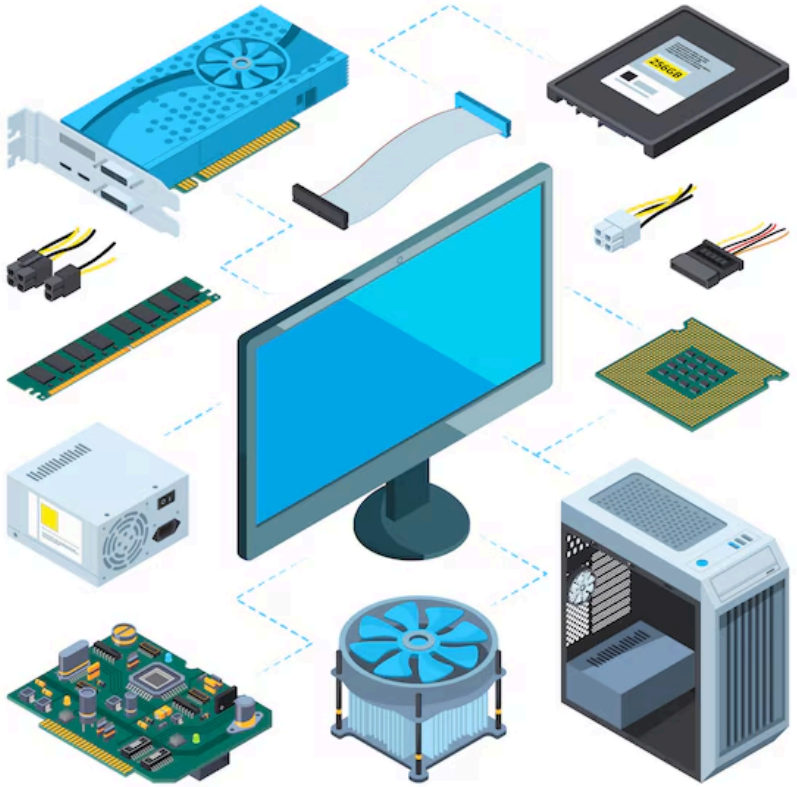

Not easy, not proven, not used.

Further work

Write a paper

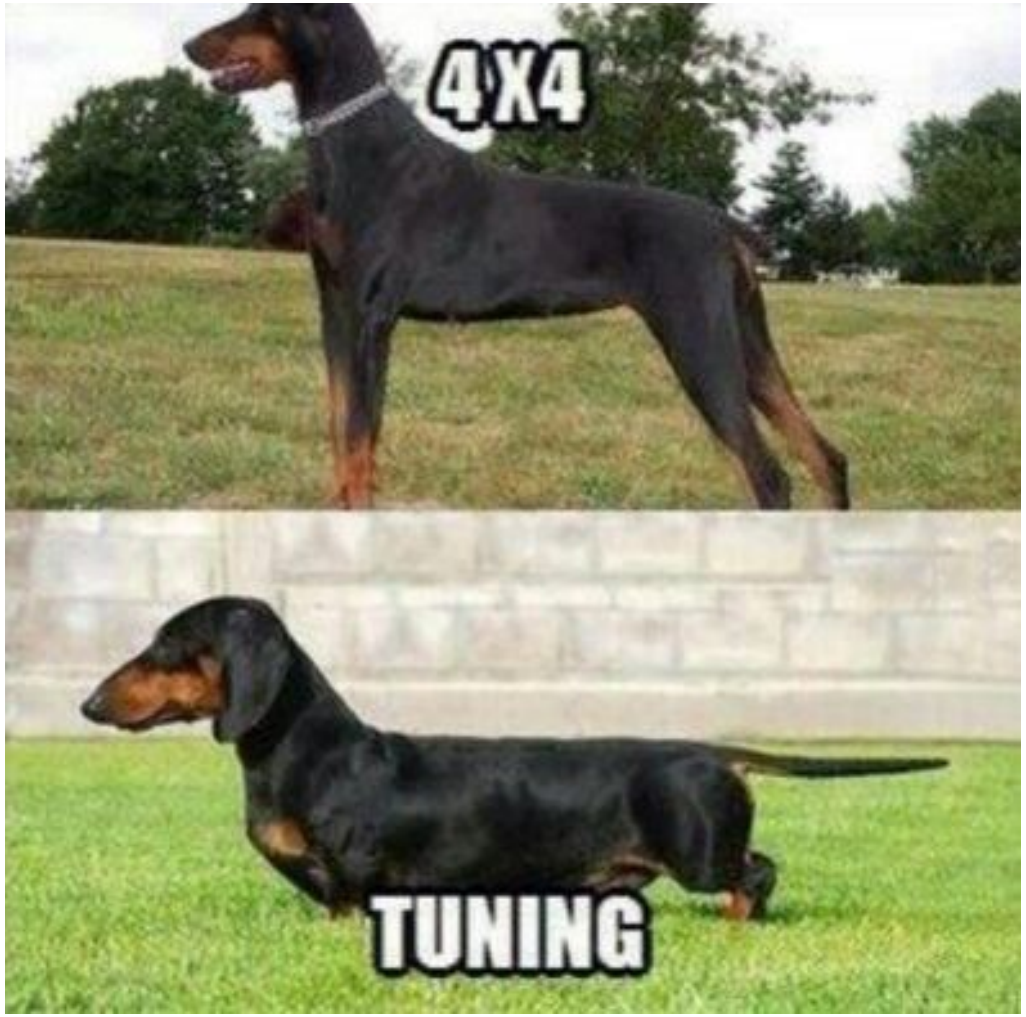

Create the next course

Mind the "abstraction level" of the course, it should be just above the level of DSA course, so it can reuse the already created definitions.

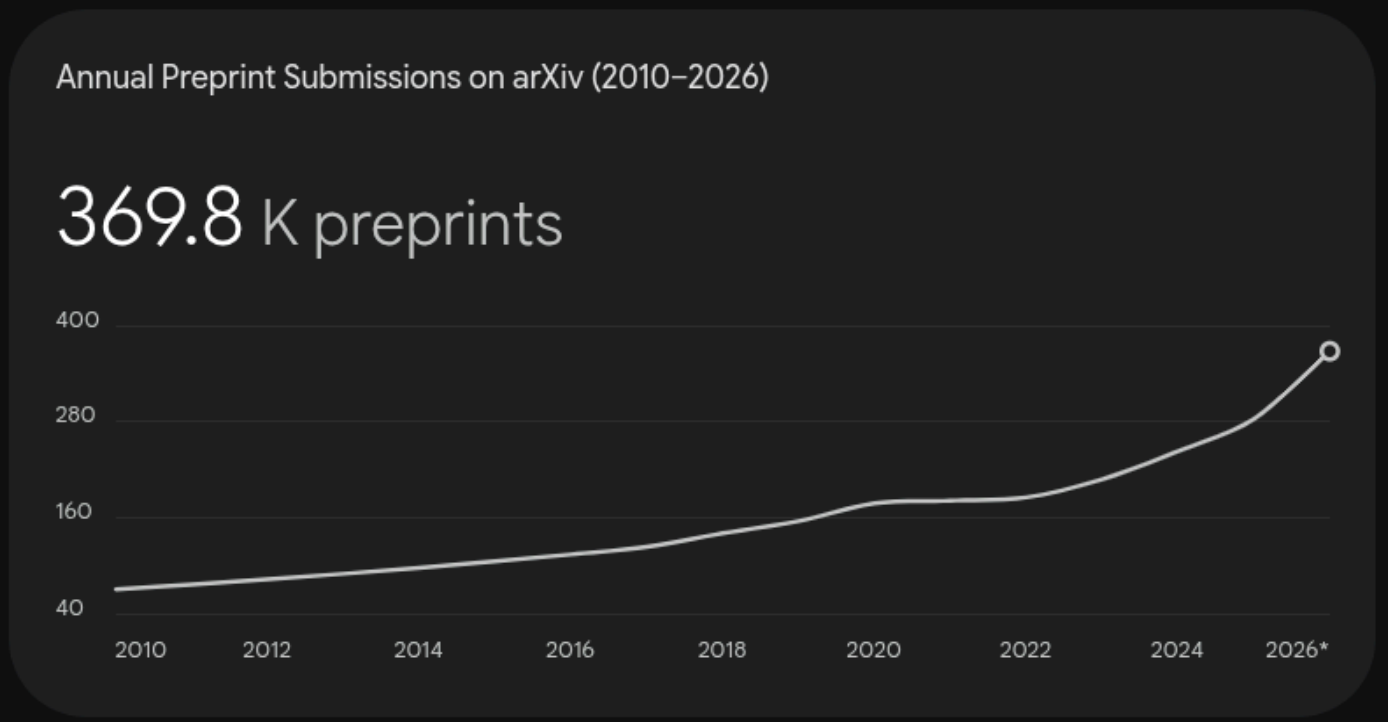

High quality dataset for LLMs

Data from LLMs, for LLMs. Fine-tuning, RAGs.

"New kind of science"

Focusing on the 2010–2026 window highlights the post-2022 LLM inflection point even more clearly. Between 2010 and 2020, arXiv preprint submissions grew steadily from 70,100 to 178,300 per year before plateauing during 2021–2022 at just ~2% annual growth. Beginning in 2023, annual volume broke sharply upward—more than doubling the pre-LLM plateau pace to reach an estimated **369,800 submissions in 2026.**

Reducing the number of preprints, articles, books.

Please generate a thank you slide for the audience. Don't make a mistake.
